Comments from Art Drysdale

I've heard it said, many, many times, that "Art Drysdale will never take a look at organic products and never recommend them!"

The reason given is variable, and is literally never correct but no one has ever checked with me as to why, before making one of those statements. Yes, I seldom recommend organic products basically for two reasons: **1)** they are virtually always more expensive because they are much more costly to manufacture; and **2)** in fertilizers, the plants that you're feeding are NOT able to distinguish between organic or synthetic nutrients, and in pesticides, there is NO evidence generally that organic controls are safer than synthetic ones and in some cases the exact opposite is the fact.

So, what has happened recently to change my mind? At least two developments in the last decade are significant. First, the mounting evidence that while plants cannot tell the difference in the source of their nutrients, they certainly do better in soils that contain a higher count of organisms. And, we do know that high percentage NPK synthetic fertilizers do kill many of these organisms. Hence, for the past several years I have been seriously looking at organic-type products such as Gaia Green's premium organic fertilizer line.

The second change is that there is finally a presence of truly organic products whereas previously many were borderline. The Gaia Green line is the most complete line of organic fertilizers and soil amendments that are truly organic. When looking at the nutritional value of organic versus synthetic chemical fertilizers, and the resultant plant vitality, Gaia Green products have been proven superior, making them cost effective. Kilo for kilo Gaia Green blended organic fertilizers are approximately half the cost of the leading slow release chemical fertilizers.

That in a nutshell is why Art Drysdale is now not only using organic products (which I have for over a decade) but also recommending them to his many listeners, readers and viewers.
